## In This Issue

- \* **Reduce Implant Costs.**
- \* **Screw-retained restorations eliminate Peri-implantitis caused by cement.**

## Implant Case Tips

**Q:** Steve, how can I save on implant lab fees, make a more hygienic, screw-retained crown and still have an esthetic and functional restoration?

**A:** After-market implant companies reduce costs and provide excellent quality solutions beyond what the implant manufacturers themselves offer. Argen, NT Trading, and other manufacturers offer great money-saving restorative solutions while backing them with excellent guarantees covering both their products and the implants they connect to.

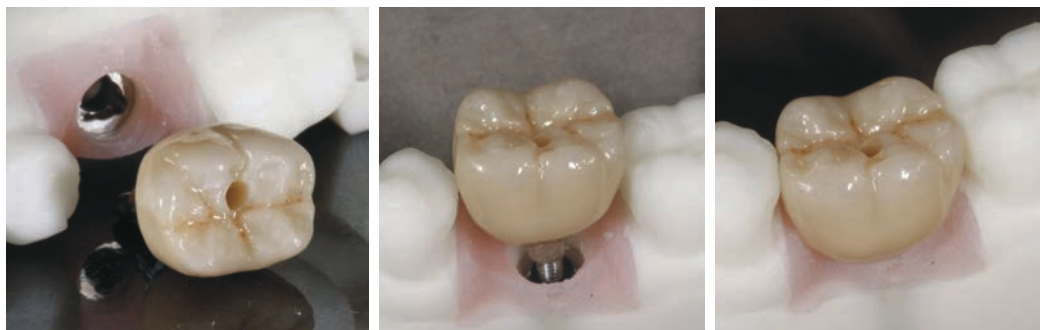

Screw-retained restorations are back in demand because recent published studies have found long-term failures of implants where Peri-implantitis was present was caused by cement remaining around the margins of crowns cemented to implant abutments. Simple screw-retained crowns easily eliminate this possibility. Killian Dental has the ability to create smaller screw access holes for these restorations making it easier to fill and hide the hole for an esthetic restoration that is also exceptionally hygienic.

We've sharpened our pencil to create pricing and value to fit everyone's budget. Here are the photos of our top selling products:

**Ti Base with e.max® or Bruxzir® crown**  
(Includes Model and Analog as shown)...**Call for our Low Price.**

**Ti Base with Provisional PMMA crown...\$ave**
